ESSILOR: TARGET OF A CYBER ATTACK

On Saturday 21 March 2020, Essilor was the target of a cyber attack, which has temporarily disrupted access to some Group servers and personal computers.

The malware is a new type of virus. Essilor IT teams took immediate action with the support of external experts, to limit the spread of the malware, prevent data thefts and leaks and protect the data and system.

No data leak has been identified to date. The affected servers have been isolated and new patches and firewalls have been installed. This is allowing us to progressively restart the servers in a secure way.
